

Nestly

Complete Workflow Diagrams

Generated from docs/WORKFLOW.md — one product/business flow per page. Wide fan-out flows are landscape; the customer and partner journeys are portrait so the full top-down flow stays large and readable.

Nestly — Workflow Diagrams

PURPOSE

A visual map of how the marketplace actually works, end to end, for anyone getting oriented on the project — product, QA, a new engineer, or an external reviewer. It answers "what happens when...", not "which class does this."

This document is **not authoritative**. It is a diagram companion to the documents that already own these topics — [SRS.md](#) for functional requirements and the booking lifecycle, [PARTNER.md](#) for the provider/partner module, [tasks.csv](#) for what's built vs. outstanding. Where a diagram here and the SRS disagree, the SRS is correct and this file is stale.

Source: reconciles the original product workflow sketch (`Urban.docx` , repository root) against the current SRS and backlog. Six flows the sketch implied but the backlog didn't yet have tasks for were added to [tasks.csv](#) as #155–#160 (dispute resolution, push notifications, commission setup, escrow, provider reassignment, background verification) — they appear below as real flows, not aspirational ones.

One naming note up front: the sketch and everyday conversation call the person doing the job a "Provider" or "Service Provider." Nestly's own backlog and domain model call the same role "Partner" (see PARTNER.md) — a deliberate rename made when the module was scoped, currently deferred to Phase 8. This document uses **Partner**, and calls out the sketch's term in parentheses the first time each diagram needs it.

1. Entry Point

Every visitor lands here before splitting into a Customer or a Partner.

2. Customer Workflow

The core booking journey, from registration through to a closed booking. Provider acceptance is where SRS 13 branches: rejection returns the booking to the assignment pool for reassignment rather than jumping straight to refund (task #159) — refund is the fallback only if no partner picks it up in time.

3. Partner Workflow (Provider / Service Provider)

Partner onboarding, going live, and earning. KYC document upload and background verification (#160) are two distinct steps in the real backlog, not one — a submitted Aadhaar/PAN scan being well-formed is not the same check as the person behind it having a clean background.

4. Booking State Machine

The diagrams above describe the *experience*; this is the actual state machine behind it (`BookingStatus` , SRS 13.1 — see [Booking.cs](#)). It has more real states than a product sketch usually shows, because failure and cancellation paths matter as much as the happy path.

5. Payment Workflow

Money's path from customer to partner, including the platform's cut. The holding step and the commission step are each their own backlog item (#158, #157) — before those, the payments schema went straight from transaction to refund/wallet with no explicit holding period or platform-commission calculation.

6. Dispute Workflow

Formalizes the branch SRS calls out under support ("wrong charge / pricing dispute") into its own flow — distinct from a general support ticket, which may never need this valid/invalid split (#155).

7. Review & Rating Flow

8. Notification Flow

SMS and email dispatch already exist in the backlog (#31, #87); push is the one channel that didn't (#156) — this flow treats all three as one dispatch fan-out per event, not three separate implementations.

9. Admin Workflow

What the admin dashboard covers, grouped by the phase that builds it (Phase 6 — see tasks.csv). Commission setup and dispute resolution are the two sections tied to the previously-missing flows above.

Where each flow lives in the backlog

Flow	Primary phase(s)	Key task IDs
Customer booking journey	Phase 3 — Booking Core	#50–#65
Partner onboarding & earnings	Phase 7 — Partner	#144–#149, #159, #160
Payments, escrow, commission	Phase 4 — Payments & Financial	#67, #74, #157, #158
Dispute resolution	Phase 5 — Post-Booking	#84, #86, #155
Reviews & moderation	Phase 5 — Post-Booking	#85, #122, #123
Notifications	Phase 5 — Post-Booking	#31, #87, #88, #156
Admin dashboard	Phase 6 — Admin Panel	#90–#143
Referral & growth (REFERRAL.md)	Phase 9 — Referral & Growth	#155–#176
Subscription, recurring bookings, chat, completion verification (PRODUCT-ENHANCEMENTS.md)	Phase 10 — Product Enhancements	#177–#198
Nestly Coins reorder loyalty (NESTLY-COINS.md)	Phase 11 — Nestly Coins & Loyalty	#156–#160

Note on Partner's phase number: moved from Phase 8 to Phase 7 on 2026-07-31 — it now runs *before* Hardening & Launch (Phase 8), not after everything else. See PARTNER.md's STATUS section.

Known task-ID drift (flagged, not yet reconciled): this table's Referral/Product-Enhancements ID ranges (#155–#198) describe tasks that were never actually added as rows to [tasks.csv](#) — that file's real IDs stop at T151 (Partner) before jumping to T152+ (hardening/bug-fix tasks added 2026-08-01/02, including T155–T165, which are unrelated to what this table's "#155" etc. describe). Reconciling the two is its own cleanup task — until then, treat this table's IDs as REFERRAL.md/PRODUCT-ENHANCEMENTS.md's own internal numbering, not literal tasks.csv row IDs.

Not yet diagrammed above: the Referral, Product Enhancements, and Nestly Coins flows are new since this document's diagrams were drawn (sections 1–9 predate Phase 9/10/11). The spec docs (REFERRAL.md, PRODUCT-ENHANCEMENTS.md, NESTLY-COINS.md) are authoritative for those flows until diagrams are added here.

For current status of any of these (done / todo / blocked), see the summary rows at the top of [tasks.csv](#) or run:

```
python3 /path/to/autopilot-local/tasklib.py counts tasks.csv
```
